

“Why should I get tested?”

I feel fine.”

Did you know that you can have hepatitis C for many years and not know it? Many people don't!

Hepatitis C is spread through infected blood to blood contact, for example by sharing a toothbrush or a razor with someone who has it. Finding out if you have it or not is as simple as a quick blood test.

If you don't have hepatitis C there are simple things you can do to protect yourself. If you do, there are many treatments available. ***In many cases it can be cured.***

If you have any questions or would like to know more, see your health care provider.

**Protect yourself
and the people you love.**

Know your status – get tested!
